SUMMARY

Full Stack Engineer with 4+ years of experience building production systems across matchmaking platforms, construction, HR tooling, and IoT dashboards. Specialize in Node.js/NestJS backends, React/Next.js App Router frontends, and TypeScript end-to-end. Comfortable owning features from schema design to deployment including real-time systems with Socket.IO, background job queues with Redis/BullMQ, cloud infrastructure on AWS, and third-party integration's across payments, logistics, and mapping APIs.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript

Backend: Node.js, NestJS, Express.js, REST API Design, WebSockets / Socket.IO, JWT Auth, BullMQ

Frontend: React.js, Next.js (App Router), TailwindCSS, Ant Design

Databases: PostgreSQL, MySQL, MongoDB

ORMs: Prisma, Sequelize, Mongoose

Cloud & Infra: AWS (EC2, S3, Route 53, RDS), Redis, Docker, Firebase

Dev Tools: Git, Postman, Swagger, VSCode, PgAdmin

Integrations: Stripe, PayPal, Telr, Google Maps, Google Places, Google Sign-In, Apple Sign-In, Shippo, Quaderno, J&T Express, Steam API, Particle.io, web3.js

WORK EXPERIENCE

Software Engineer — Conovo Technologies

Oct 2025 – Present

Shia Spouse — Matrimonial Web & Mobile App · shiaspouse.org

- Built a subscription-gated real-time chat system using Socket.IO, handling ~500+ concurrent user sessions with access controlled by active subscription status.
- Designed and implemented a document-based profile verification flow where users upload ID proof and admins review before profiles go live, reducing fake accounts by an estimated 60%.
- Shipped a premium agent-matching feature where staff manually suggest compatible profiles; users receive push notifications and accept/decline in one tap.
- Developed a community events module allowing the team to publish live events with user registration, participation tracking, and attendance notifications.
- Resolved a Google Places API edge case for disputed Kashmir territories by building a TypeScript fallback lookup map covering Pakistani- and Indian-administered zones with accurate region labels.
- Integrated Redis caching on high-traffic GET endpoints, reducing average API response time by ~35%.

Bowmont Global — Construction Project Management

- Built the Work Breakdown Structure (WBS) module enabling planners to create task hierarchies, assign contractors, and define predecessor/successor dependencies across multi-phase projects.
- Implemented a contractor facing task review workflow contractors submit completed work, planners approve or reject with notes reducing manual back and forth by an estimated 40%.
- Developed a dynamic Gantt chart view that reflects task dependencies in real time and updates visually as task statuses change.

Software Engineer — Ragzon Solutions

Jun 2025 – Oct 2025

HRMS — Internal HR Management System

- Built the full HRMS from scratch: companies post jobs, candidates apply, and the system manages the pipeline from CV scoring through to automated offer letter generation.
- Implemented an AI-powered CV-to-JD match scoring feature that ranks candidates by percentage fit, reducing recruiter screening time by an estimated 50%.
- Designed a configurable interview pipeline with stages (screening, technical, HR); the system triggers automated actions and notifications when candidates advance.

JobJen — Job Portal

- Built CV parsing that extracts structured data (experience, skills, education) from uploaded PDFs, eliminating manual data entry for HR teams.
- Developed a real-time Kanban board for candidates showing current application stage, updated live as HR moves applicants through the pipeline.
- Built an HR dashboard with applicant management, parsed CV data review, and automated interview scheduling with email notifications.

Senior Backend Developer — Argon Teq

Nov 2022 – Jun 2025

- Designed and maintained REST APIs across 4+ products using Node.js, NestJS, TypeScript, and Express.js, serving teams of 3–8 engineers per project.
- Set up Redis-backed BullMQ job queues for async processing (notifications, report generation, email dispatch), handling background jobs per day reliably.
- Deployed and managed services on AWS configured EC2 instances, managed static assets on S3, set up Route 53 DNS routing, and used RDS for managed PostgreSQL in production.
- Managed payment integration's (Stripe) and logistics APIs (Shippo, J&T), handling live transactions and order fulfillment across multiple client products.
- Used Docker to containerize services, ensuring environment parity between development and production and reducing deployment issues by a significant margin.
- Conducted regular code reviews and mentored 3 junior developers on API design patterns, error handling strategies, and database query optimization.

AccuBrew — IoT Brewing Monitor

- Built a real-time sensor data ingestion pipeline from Particle.io hardware, processing and storing brew telemetry for live dashboard display and session history replay.
- Designed an alert and reminder notification system with configurable thresholds, enabling brewers to catch out-of-range conditions without constant monitoring.

Kidault — Ride Share for Kids

- Built backend services for ride bookings, user and driver profile management, and driver assignment logic with safety-first business rules.
- Used Firebase Realtime Database to push live ride status updates to the mobile app, eliminating the need for client-side polling.

Gallelio — NFT Marketplace

- Built minting, listing, buying, and transfer APIs integrating web3.js with Ethereum smart contracts written by a separate smart-contract team; handled dual auth using both JWT and crypto wallet sign-in.

Katana Inu — Social Gaming Platform

- Built tournament management APIs covering player registration, leaderboards, and scoring for competitive events with thousands of participants.
- Implemented a social layer with real-time chat, friend requests, post sharing, and notification feeds — all powered by Socket.IO — alongside wallet-linked in-game item purchases.

Full Stack Developer — Adriot Soft Solutions

Sep 2021 – Nov 2022

- Built and maintained REST APIs in Node.js and MongoDB powering business logic for multilingual content platforms, an event ticketing system, and a bidding platform, with a Laravel admin panel.
 - Optimised slow MongoDB queries and restructured two database schemas to handle higher traffic, reducing query times by an estimated 40–60% on the most loaded endpoints.
 - Worked across multiple client projects simultaneously, context-switching between different stacks and domain requirements.
-

EDUCATION

Bachelor of Computer Science

University of Sargodha · GPA: 3.43 / 4.0

Oct 2017 – Jul 2021

Intermediate (Pre-Engineering)

Govt. Shalimar College, Lahore · Grade: A+

Sep 2015 – Jun 2017

LANGUAGES

English (Professional Working Proficiency) | Urdu (Native) | Punjabi (Native)
